Webitel Console

It is the only element in Webitel structure without open access. It's job are checking the licence status, generation of proper user configuration and monitoring current statuses and states of telephony users. There are no external applications that interact with **Console.** It would be impossible to register a SIP phone, connect a SIP provider or check the current user status without the **Console**.

SQLite database is used to store information about active users, connected SIP providers and other crucial system settings. It requires active connection to the telephony server to be able to handle events and receive API commands.

Port	Usage
6873/tcp	Console management (handling of events, receiving API command)
10024/tcp	HTTP server. Generates XML configuration for telephony server.
