

# 12 Calendars

This section is designed to create various calendars that can be used both in call routing and in Dialer.

3.3.0

The calendar has the following parameters:

- **Work week** - for each day of the week, one or several working time ranges "from hour: minute" - "by hour: minute" can be specified separately.
- **Holidays** - are set separately, as calendar dates. Can be set with annual repetition or a single day.

To use the calendar in [routing](#), you must call the [calendar specifying](#) the name of the calendar and a variable to return the result of the check:

```
{
  "calendar": {
    "name": "Company business calendar",
    "setVar": "isWorkDay"
  }
}
```

If the current time falls into the **Work** condition of the calendar, then the variable will be set to **true**, otherwise - **false**
